

Assignment – I

1. Find all files that are more than 100 bytes in size and display the number of characters, words and lines in each file
2. Change the modification time to current time for those files that have been modified 5 minutes ago.
3. Remove the read permission for others for all .c files in your home directory and subdirectories.
4. You want a make default permission for directories to be rwxr--r--. Set your umask variable accordingly. Create some directories to see whether it is working or not
5. Create a hard link 'copy' of the command 'cp' in your home directory. Use this 'copy' command to copy any existing file to another file.
6. Suppose you have a C program (say add.c) that takes the name of a person and telephone number as command line arguments and appends this information to a file 'telDir.dat'. Consider 'add.o' is the object file created after compilation. Ask one of your friends to execute this file and examine the result. Set the User ID bit for this file and ask your friend to execute this file again and examine the result.
7. A shared directory is to be created for project group. Implement this using sticky bit.
8. Copy /etc/passwd file in your home directory as password. Substitute the word 'bash' by the word 'sh' using vi editor.
9. Each line in password file contains several fields separated by ':'. Substitute all occurrence of ':' by '|' using vi editor.
10. Substitute all occurrences of the word 'home' from line number 100 to 200 of 'password' file using vi editor.
11. Delete all lines from a file containing the word 'unix'.
12. Write a shell script, which gets executed the moment the user opens a terminal. It should display the message "Good morning"/"Good Afternoon"/ "Good evening" depending upon the time.
13. The file /etc/passwd contains information about all the users. Write a shell script which would receive the login name during execution, obtain information about it from /etc/passwd and display the information on the screen in easily understandable format.
14. Write a shell script, which receives two filenames as arguments. It should check whether the two file's contents are same or not (Files may have arbitrary blank lines and the command "cmp" would not work in this case). If they are same one would be deleted.
